Important information

All current safety regulations and guidelines applicable in those countries where our products are used must be observed.

The photos shown in this brochure feature construction sites in progress. For this reason, safety and anchor details in particular cannot always be considered as conclusive or final. These are subject to the risk assessment carried out by the contractor.

In addition, computer graphics are used which are to be understood as system representations. For ensuring a better understanding, these and the detailed illustrations shown have been partially reduced to show certain aspects. The safety installations which have possibly not been shown in these detailed descriptions must nevertheless still be available. The systems or items shown might not be available in every country.

Safety instructions and load specifications are to be strictly observed at all times. Separate structural calculations are required for any deviations from the standard design data.

The information contained herein is subject to technical changes in the interests of progress. Errors and typographical mistakes reserved.
PROKIT EP 200 protects site personnel during construction of building shells against falling. The system ensures safe working areas and access ways thus increasing safety levels of jobsite personnel as well as improving work efficiency. In addition, the 2.00 m high mesh barriers prevent material from falling off the edge of the building. With just a few individual components, PROKIT EP 200 can be assembled very quickly without any tools.

Assembly of the PROKIT EP 200 anti-fall protection is extremely simple: high-quality tension belts – securely connected between two supports – serve as a mounting support for the PROKIT Fold Mesh. The 2.00 m high, close-meshed barriers are easily attached to the tension belts with cable ties. Mounting this anti-fall protection is thus carried out completely independent of the slab itself, and the concrete components remain undamaged.

The mesh barrier only weighs 7.5 kg and provides enhanced work ergonomics. The yellow powder coating increases the signal effect at the hazardous area; it is very durable and ensures a long life of the mesh screen.

If necessary, e.g. for inner-city construction sites, 2 screens can be arranged one on top of each other as a floor-to-slab enclosure. With additional netting, the PROKIT EP 200 can also be used as dust protection.

- **Reliable and safer protection** against falling from open edges on building shells (in accordance with DIN EN 13374, Class A).
- **Fast assembly** with only a minimum of lightweight individual components as well as easy to handle connecting means such as tension belts and cable ties.
- **Floor-to-ceiling enclosure** up to 3.90 m for optimal protection with increased requirements.
- **Slab-independent fixing** without any damage to the existing building structure.
The Tension Belt PTB 12 is tensioned between two supports and forms the sub-construction for the Fold Mesh PFR. The two-piece belt with a length of 12.00 m is equipped with hooks and securing straps.

The Fold Mesh sections have integrated hooks and eyelets on the longitudinal sides are easily attached to the adjacent element. As the lower hook is 5 cm longer than its counterpart at the top end of the mesh, threading is done quickly and without any effort.

The Fold Mesh room height PFR with a height of 2.00 m and a width of around 66 cm, only weighs 7.5 kg.

The Fold Mesh room height PFR with a height of 2.00 m and a width of around 66 cm, only weighs 7.5 kg.

The tension belts are pulled through the eyelets, the hooks are attached which closes the strap around the support.

Cable Ties PCT serve to attach the Fold Mesh to the Tension Belts. They are matched to the system and UV-resistant.

For preventing any damage to the support edges, a plastic hose is used which is pulled over the tension belt.
System advantages

Fast assembly

Belt assembly in detail
The extremely tear-resistant belt is placed around the first support, then looped around the second column. The ratchet is used to tighten with around 5 kN to 6 kN preload force.

PROKIT Tension Belts are approved and tested according to EN 12195-2 and the corresponding label is sewn on the lashing strap.

If required, two meshes can also be mounted one on top of the other with the overall height then reaching up to 3.90 m. However, three tension belts are normally sufficient. If securing working operations means that the mesh is installed directly up to under the slab, four tension belts are to be used.
Practical system supplements

PERI PROKIT EP 200 is suitable in particular for use in high skeleton structures. The design of the 2.00 m high side protection gives site personnel a greater sense of security so that working efficiency at large heights is increased.

With the galvanized Wall Fixing PWF, the tension belts can be fixed to the rising walls.

Also on working platforms, the PROKIT Fold Mesh serves as 2.00 m high protection.

For easy handling and safe logistics, 45 meshes can be stacked and transported on one pallet.
### Fold Mesh Room Height PFR

<table>
<thead>
<tr>
<th>Item no.</th>

</tr>
</tbody>
</table>

Two parts.

**Note**

Consider information on the belt Label!

**Technical Data**

- Total length 12 m, max. span 8 m.
- Permissible tension force 2.5 t.

### Cable Tie PCT

<table>
<thead>
<tr>
<th>Item no.</th>
<th>Weight kg</th>

**Pallet RP-2 80 x 120, galv.**  
For stacking and transportation of formwork and scaffolding components.

**Note**  
Follow Instructions for Use!

**Technical Data**  
Permissible load 100 kg/m².
